

IDEATION PHASE

Empathize and discover

Date	31 October 2025
Team ID	5C726FBC80DF9BA96244FB7712CD1C0D
Project Name	CRM Application for Jewel Management

1. Empathize

The **Empathize** stage aims to understand the actual problems faced by jewellery shop owners, staff, and customers in their day-to-day operations. Through discussions, observations, and online research, common difficulties were identified in how jewellery businesses manage sales, inventory, and customer relations.

Key Findings:

- **Manual Operations:**
Example: A local jewellery shop uses notebooks and Excel sheets to record customer purchases. During festival seasons, staff often lose track of pending orders and payment details due to manual errors.
- **Customer Relationship Gap:**
Example: When a regular customer visits again, staff are unable to recall their previous purchases or preferences (like favourite design types or gold purity), which affects personalized service and loyalty.
- **Inventory Challenges:**
Example: The shop owner struggles to maintain accurate counts of gold, silver, and diamond jewellery. Sometimes, a product appears “out of stock” in records but is actually available in-store.
- **Lack of Automation:**
Example: Generating sales reports at the end of the month takes hours of manual work. Invoices are written by hand, increasing the risk of pricing mistakes.
- **Data Security:**
Example: Important sales and billing data stored in local computers or papers are at risk of loss or damage due to system crashes or misplacement.

Empathy Goal:

To understand these real-world problems deeply and design a **smart, automated, and reliable system** that simplifies business operations, minimizes errors, and provides better customer satisfaction.

2. Discover

In the **Discover** stage, possible solutions were explored based on the problems identified during the Empathize phase. The goal was to find a modern, scalable, and easy-to-use platform that can digitalize all jewellery management processes.

Research & Observations:

- Salesforce CRM was identified as the most suitable platform due to its **cloud-based structure, high security**, and **automation tools** like Flows, Validation Rules, and Dashboards.
- Analysis of similar retail CRMs showed that integrating **customer data, inventory, and billing** into one centralized system improves efficiency and decision-making.

- Salesforce's **record-triggered automation** and **approval workflows** can replace repetitive manual tasks like updating stock or generating invoices.

Example:

During the research, a small jewellery business that adopted Salesforce for managing customer data was found to reduce its manual recordkeeping time by nearly **40%**, showing how CRM automation can truly improve productivity and accuracy.

Insights Gained:

- Shop owners need **real-time visibility** of stock and sales data.
- Sales staff need **simple interfaces** to handle orders and invoices.
- Customers expect **quick and accurate** billing with digital receipts.
- Management needs **dashboards and reports** for tracking top customers and sales performance.

Outcome of Discovery Phase:

After evaluating different ideas, the team finalized the concept of “**CRM Application for Jewel Management**” a **Salesforce-based cloud system** designed to automate jewellery inventory, sales, billing, and customer management. This solution ensures data accuracy, enhances productivity, and provides real-time analytics to improve decision-making.
